Motivation of ∞ -categories

Motivation 1

The most significant motivation is to change the morphism **set** $\text{Hom}_{\mathcal{C}}(X, Y)$ in a category \mathcal{C} to a topological **space** $\text{Map}_{\mathcal{C}}(X, Y)$. Then we can have higher morphisms $\pi_n \text{Map}_{\mathcal{C}}(X, Y)$.

For example when considering the category of spectra, we have $\pi_n \text{Map}_{\mathcal{C}}(X, Y) = [\Sigma^n X, Y]$.

Motivation 2

We want to **internalize** the category theory. In another way, we want to **characterize** a specific ∞ -category by a universal property in the ∞ -category of all ∞ -categories Cat_{∞} .

For instance, we will see the ∞ -category of spaces \mathcal{S} is "free generated" by the single-point space $* \in \mathcal{S}$.

Motivation of ∞ -categories

Motivation 1

The most significant motivation is to change the morphism **set** $\text{Hom}_{\mathcal{C}}(X, Y)$ in a category \mathcal{C} to a topological **space** $\text{Map}_{\mathcal{C}}(X, Y)$. Then we can have higher morphisms $\pi_n \text{Map}_{\mathcal{C}}(X, Y)$.

For example when considering the category of spectra, we have $\pi_n \text{Map}_{\mathcal{C}}(X, Y) = [\Sigma^n X, Y]$.

Motivation 2

We want to **internalize** the category theory. In another way, we want to **characterize** a specific ∞ -category by a universal property in the ∞ -category of all ∞ -categories Cat_{∞} .

For instance, we will see the ∞ -category of spaces \mathcal{S} is "free generated" by the single-point space $* \in \mathcal{S}$.

Extracting information from an ∞ -category

The most intuitive model for ∞ -category is the $sSet$ -enriched (or Top -enriched) category. Actually we have a Quillen equivalence $sSet_{Joyal} \rightleftarrows Cat_{\Delta}$.

Mapping spaces

There are at least 4 definitions of the mapping space $Map_{\mathcal{C}}(X, Y)$ in an ∞ -category \mathcal{C} . But when we take their underlying $Ho(sSet_{Kan})$ -enriched categories, all of them are the same, written as $\underline{h}\mathcal{C}$. (*** most important invariant)

How to extract useful and discard redundant information in certain circumstances is an art in ∞ -category's world.

Example

For example when we want to show a functor between ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ is an equivalence, it suffices to show $\underline{h}F : \underline{h}\mathcal{C} \rightarrow \underline{h}\mathcal{D}$ is equivalent.

But if we consider colimits in an ∞ -category \mathcal{C} , we need more homotopy coherent information than those in $\underline{h}\mathcal{C}$. In this case, we can't reduce to $\underline{h}\mathcal{C}$.

Extracting information from an ∞ -category

The most intuitive model for ∞ -category is the $sSet$ -enriched (or Top -enriched) category. Actually we have a Quillen equivalence $sSet_{Joyal} \rightleftarrows Cat_{\Delta}$.

Mapping spaces

There are at least 4 definitions of the mapping space $Map_{\mathcal{C}}(X, Y)$ in an ∞ -category \mathcal{C} . But when we take their underlying $Ho(sSet_{Kan})$ -enriched categories, all of them are the same, written as $\underline{h\mathcal{C}}$. ($***$ most important invariant)

How to extract useful and discard redundant information in certain circumstances is an art in ∞ -category's world.

Example

For example when we want to show a functor between ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ is an equivalence, it suffices to show $\underline{hF} : \underline{h\mathcal{C}} \rightarrow \underline{h\mathcal{D}}$ is equivalent.

But if we consider colimits in an ∞ -category \mathcal{C} , we need more homotopy coherent information than those in $\underline{h\mathcal{C}}$. In this case, we can't reduce to $\underline{h\mathcal{C}}$.

Why use ∞ -categories?

Some phenomena or propositions can't be stated clearly without ∞ -category.

Example

(1) Chromatic convergence and chromatic pullback:

$$\begin{array}{ccc} & \vdots & \\ & \downarrow & \\ & L_1 X & \\ & \downarrow & \\ X & \longrightarrow & L_0 X \end{array} \quad \begin{array}{ccc} L_n X & \longrightarrow & L_{K(n)} X \\ \downarrow & & \downarrow \\ L_{n-1} X & \longrightarrow & L_{n-1} L_{K(n)} X \end{array}$$

They are homotopy limits of **homotopy**

coherent diagrams $N_*(\mathbb{Z}_{\geq 0}^{op}) \rightarrow Sp$ and $\Lambda_2^2 \rightarrow Sp$. However, classical framework only provides homotopy diagrams, which can't be used to take homotopy limit.

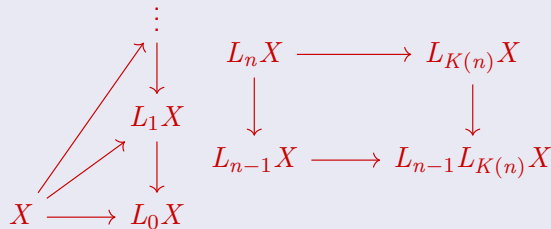

(2) Postnikov tower in the category of spaces \mathcal{S} and its convergence are the same philosophy as above.

Why use ∞ -categories?

Some phenomena or propositions can't be stated clearly without ∞ -category.

Example

(1) Chromatic convergence and chromatic pullback:

They are homotopy limits of **homotopy**

coherent diagrams $N_*(\mathbb{Z}_{\geq 0}^{op}) \rightarrow Sp$ and $\Lambda_2^2 \rightarrow Sp$. However, classical framework only provides homotopy diagrams, which can't be used to take homotopy limit.

(2) Postnikov tower in the category of spaces \mathcal{S} and its convergence are the same philosophy as above.

Why use ∞ -categories?

Example

- (2) Equivariant stable homotopy theory: there are plenty of model categories characterizing it, but all of their underlying ∞ -category are equivalent with $\text{Fun}(BG, Sp)$, which is both simple and intuitive.
- (3) In ∞ -framework, the E_∞ -operad is just commutative operad. And E_∞ spaces, E_∞ -spectra are ∞ -commutative monoid objects.
- (4) We have all kinds of well-defined moduli spaces, like $\text{Fun}^\otimes(C, D)$, $\text{Fun}^{lax}(C, D)$ and $\text{Cal}(C) \times_C \{X\}$.
- (5) Bousfield localization of an E_∞ -ring is still an E_∞ -ring, this is directly by the fact $Sp^\otimes \rightleftarrows Sp_E^\otimes$ is a symmetric monoidal adjunction, which will induce an adjunction $\text{Cal}(Sp) \rightleftarrows \text{Cal}(Sp_E)$ by symmetric monoidal ∞ -categorical machine. However, both model category and EKMM can not provide such a machine.
- (6) If C is a 1 -category, then $Sp(C) \simeq \{*\}$ is trivial. The stabilization for 1 -categories is meaningless.

Preventing Russell's paradox

In order to consider the **category of all categories**, we need to add a set-theoretic axiom into ZFC, i.e. Grothendieck's Assumption:

\forall cardinal κ , there exists an inaccessible cardinal $\tau > \kappa$. (A good reference: Chap 1, 代数学方法 1, 李文威)

Methodology

By Grothendieck's Assumption,

1. When not involving **category of all categories**, technically we can treat all things as small. So all propositions not involving **category of all categories** will hold in any Grothendieck universe.
2. When involving **category of all categories**, for example \mathcal{Cat}_∞ , we consider it as the ∞ -category $\mathcal{Cat}_\infty^\tau$ of all τ -small categories for an inaccessible cardinal τ . Choose a bigger inaccessible $\tau_2 > \tau$, then technically we can treat $\mathcal{Cat}_\infty^\tau$ as a τ_2 -small ∞ -category in $\mathcal{Cat}_\infty^{\tau_2}$.

Preventing Russell's paradox

In order to consider the **category of all categories**, we need to add a set-theoretic axiom into ZFC, i.e. Grothendieck's Assumption:

\forall cardinal κ , there exists an inaccessible cardinal $\tau > \kappa$. (A good reference: Chap 1, 代数学方法 1, 李文威)

Methodology

By Grothendieck's Assumption,

1. When not involving **category of all categories**, technically we can treat all things as small. So all propositions not involving **category of all categories** will hold in any Grothendieck universe.
2. When involving **category of all categories**, for example \mathcal{Cat}_∞ , we consider it as the ∞ -category $\mathcal{Cat}_\infty^\tau$ of all τ -small categories for an inaccessible cardinal τ . Choose a bigger inaccessible $\tau_2 > \tau$, then technically we can treat $\mathcal{Cat}_\infty^\tau$ as a τ_2 -small ∞ -category in $\mathcal{Cat}_\infty^{\tau_2}$.

Universal properties in the category of categories

Definition (Kan extension along a full subcategory)

Let $i : \mathcal{C}_0 \subset \mathcal{C}$ be a full subcategory, we say a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is a left Kan extension along i iff $\forall X \in \mathcal{C}$, $(\mathcal{C}_0 \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}$ is a colimit diagram, i.e. $\text{colim}_{A \rightarrow X, A \in \mathcal{C}_0} F(A) \simeq F(X)$.

Theorem

The restriction $\text{Fun}^{L\text{Kan}}(\mathcal{C}, \mathcal{D}) \xrightarrow{\sim} \text{Fun}^{\exists L\text{Kan}}(\mathcal{C}_0, \mathcal{D})$ is a categorical equivalence.

Example

Let \mathcal{C} be a small category and \mathcal{D} be a category that admits small colimits, then

(1) A functor $F : \mathcal{P}(\mathcal{C}) \rightarrow \mathcal{D}$ is a left Kan extension along the Yoneda embedding $i : \mathcal{C} \rightarrow \mathcal{P}(\mathcal{C})$ iff F preserves small colimits.

(2) For any $f \in \text{Fun}(\mathcal{C}, \mathcal{D})$, there exists a left Kan extension $F : \mathcal{P}(\mathcal{C}) \rightarrow \mathcal{D}$ along i .

(3) And hence we have $\text{Fun}^{\text{colim}}(\mathcal{P}(\mathcal{C}), \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$ is an equivalence. (e.g. $\text{sSet} \rightarrow \text{Top}$)

Universal properties in the category of categories

Definition (Kan extension along a full subcategory)

- (1) A functor $F : \mathcal{P}(\mathcal{C}) \rightarrow \mathcal{D}$ is a left Kan extension along the Yoneda embedding $i : \mathcal{C} \rightarrow \mathcal{P}(\mathcal{C})$ iff F preserves small colimits.
- (2) For any $f \in \text{Fun}(\mathcal{C}, \mathcal{D})$, there exists a left Kan extension $F : \mathcal{P}(\mathcal{C}) \rightarrow \mathcal{D}$ along i .
- (3) And hence we have $\text{Fun}^{\text{colim}}(\mathcal{P}(\mathcal{C}), \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$ is an equivalence. (e.g. $s\text{Set} \rightarrow \text{Top}$)

Definition

Let \mathbb{K} be a collection of simplicial sets. We say that an ∞ -category \mathcal{C} is \mathbb{K} -cocomplete if it admits K -diagram colimits, for each $K \in \mathbb{K}$.

We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ exhibits $\hat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if the ∞ -category $\hat{\mathcal{C}}$ is \mathbb{K} -cocomplete and for every \mathbb{K} -cocomplete ∞ -category \mathcal{D} , precomposition with h induces an equivalence of ∞ -categories $\mathrm{Fun}^{\mathbb{K}}(\hat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\sim} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Theorem

Let \mathbb{K} be a (small) collection of simplicial sets, then for any (small) ∞ -category C , there exists a \mathbb{K} -completion $C \rightarrow P^{\mathbb{K}}(C)$. That gives an adjunction $\mathrm{Cat}_{\infty} \rightleftarrows \mathrm{Cat}(\mathbb{K})_{\infty}$. e.g. $P^{\mathrm{small}}(C) = \mathrm{Fun}(C, \mathcal{S})$ and $P^{\mathrm{small}}() = \mathcal{S}$.*

Definition

Let \mathbb{K} be a collection of simplicial sets. We say that an ∞ -category \mathcal{C} is \mathbb{K} -cocomplete if it admits K -diagram colimits, for each $K \in \mathbb{K}$.

We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ exhibits $\hat{\mathcal{C}}$ as a \mathbb{K} -cocompletion of \mathcal{C} if the ∞ -category $\hat{\mathcal{C}}$ is \mathbb{K} -cocomplete and for every \mathbb{K} -cocomplete ∞ -category \mathcal{D} , precomposition with h induces an equivalence of ∞ -categories $\mathrm{Fun}^{\mathbb{K}}(\hat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\sim} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Theorem

Let \mathbb{K} be a (small) collection of simplicial sets, then for any (small) ∞ -category C , there exists a \mathbb{K} -completion $C \rightarrow P^{\mathbb{K}}(C)$. That gives an adjunction $Cat_{\infty} \rightleftarrows Cat(\mathbb{K})_{\infty}$. e.g. $P^{small}(C) = Fun(C, \mathcal{S})$ and $P^{small}(*) = \mathcal{S}$.

More examples of universal properties

Let \mathcal{D} be an ∞ -category.

Theorem (Pointedlization)

If \mathcal{D} admits final object, then there exists a pointedlization $\mathcal{D}_{*/} \rightarrow \mathcal{D}$ such that for any pointed ∞ -category \mathcal{C} the forgetful functor $\theta : \mathrm{Fun}'(\mathcal{C}, \mathcal{D}_{*}) \rightarrow \mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ is an equivalence. That provides an adjunction $\mathrm{Cat}_{\infty}^{\mathrm{Final}, \mathrm{pt}} \rightleftarrows \mathrm{Cat}_{\infty}^{\mathrm{Final}}$.

Theorem (Stabilization)

If \mathcal{D} admits finite limits, then there exists a stabilization $\mathrm{Sp}(\mathcal{D}) \rightarrow \mathcal{D}$ such that for any stable ∞ -category \mathcal{C} the forgetful functor $\theta : \mathrm{Fun}^{\mathrm{Flim}}(\mathcal{C}, \mathrm{Sp}(\mathcal{D})) \rightarrow \mathrm{Fun}^{\mathrm{Flim}}(\mathcal{C}, \mathcal{D})$ is an equivalence. That provides an adjunction $\mathrm{Cat}_{\infty}^{\mathrm{Flim}, \mathrm{st}} \rightleftarrows \mathrm{Cat}_{\infty}^{\mathrm{Flim}}$.

Example

The category spectra $\mathrm{Sp}(P(*))$ is the stabilization of the cocompletion of the trivial ∞ -category.

More examples of universal properties

Let \mathcal{D} be an ∞ -category.

Theorem (Pointedlization)

If \mathcal{D} admits final object, then there exists a pointedlization $\mathcal{D}_{*/} \rightarrow \mathcal{D}$ such that for any pointed ∞ -category \mathcal{C} the forgetful functor $\theta : \mathrm{Fun}'(\mathcal{C}, \mathcal{D}_{*}) \rightarrow \mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ is an equivalence. That provides an adjunction $\mathrm{Cat}_{\infty}^{\mathrm{Final}, \mathrm{pt}} \rightleftarrows \mathrm{Cat}_{\infty}^{\mathrm{Final}}$.

Theorem (Stabilization)

If \mathcal{D} admits finite limits, then there exists a stabilization $\mathrm{Sp}(\mathcal{D}) \rightarrow \mathcal{D}$ such that for any stable ∞ -category \mathcal{C} the forgetful functor $\theta : \mathrm{Fun}^{\mathrm{Flim}}(\mathcal{C}, \mathrm{Sp}(\mathcal{D})) \rightarrow \mathrm{Fun}^{\mathrm{Flim}}(\mathcal{C}, \mathcal{D})$ is an equivalence. That provides an adjunction $\mathrm{Cat}_{\infty}^{\mathrm{Flim}, \mathrm{st}} \rightleftarrows \mathrm{Cat}_{\infty}^{\mathrm{Flim}}$.

Example

The category spectra $\mathrm{Sp}(P(*))$ is the stabilization of the cocompletion of the trivial ∞ -category.

That provides an adjunction $\mathrm{Cat}_{\infty}^{\mathrm{Flim}, \mathrm{st}} \rightleftarrows \mathrm{Cat}_{\infty}^{\mathrm{Flim}}$.

Example

The category spectra $\mathrm{Sp}(P(*))$ is the stabilization of the cocompletion of the trivial ∞ -category.

More examples of universal properties

Definition

Let $n \geq -2$, an object Z in an ∞ -category C is n -truncated if, for every object $Y \in C$, the space $\mathrm{Map}_C(Y, Z)$ is n -truncated space.

Theorem (Truncation)

If C is a presentable ∞ -category, then there exists an n -truncation functor $C \rightarrow \tau_{\leq n} C$. Suppose that D is a presentable that all objects are n -truncated, i.e. it's an $(n+1)$ -category. Then composition with $\tau_{\leq n}$ induces an equivalence $s : \mathrm{Fun}^L(\tau_{\leq n} C, D) \rightarrow \mathrm{Fun}^L(C, D)$. That provides an adjunction $Pr^L \rightleftarrows Pr_{\leq (n+1)}^L$.

Example

- (1) An space X in \mathcal{S} is n -truncated iff all $\pi_i X$ vanish when $i > n$. Particularly $\mathcal{S}_{\leq 0} \simeq N(\mathrm{Set})$.
- (2) An n -truncated object Cat_∞ is exactly an n -category. And all n -categories form an $(n+1)$ -category $(\mathrm{Cat}_\infty)_{\leq n}$.

More examples of universal properties

- (2) An n -truncated object Cat_{∞} is exactly an n -category. And all n -categories form an $(n+1)$ -category $(\mathrm{Cat}_{\infty})_{\leq n}$.

Higher commutative monoid

Definition (Reformulate commutative monoid)

A commutative monoid in an ordinary category \mathcal{C} which admits finite products is a functor $M : (Fin_*)_{\leq 3} \rightarrow \mathcal{C}$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the \mathcal{C} for $0 \leq n \leq 3$.

Definition

Let \mathcal{C} be an ∞ -category with finite products, we define a commutative monoid as a functor $M : N_*(Fin_*) \rightarrow \mathcal{C}$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the \mathcal{C} for all $n \geq 0$.

Proposition

Let \mathcal{C} be an n -category with finite products, then $Fun^{CM}(N_*(Fin_*), \mathcal{C}) \xrightarrow{\sim} Fun^{CM}(N_*(Fin_*)_{\leq (n+2)}, \mathcal{C})$ is categorical equivalent since in this case any commutative monoid $M : N_*(Fin_*) \rightarrow \mathcal{C}$ is a right Kan extension along $N_*(Fin_*)_{\leq (n+2)} \subset N_*(Fin_*)$.

Higher commutative monoid

Definition (Reformulate commutative monoid)

A commutative monoid in an ordinary category \mathcal{C} which admits finite products is a functor $M : (Fin_*)_{\leq 3} \rightarrow \mathcal{C}$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the \mathcal{C} for $0 \leq n \leq 3$.

Definition

Let \mathcal{C} be an ∞ -category with finite products, we define a commutative monoid as a functor $M : N_*(Fin_*) \rightarrow \mathcal{C}$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the \mathcal{C} for all $n \geq 0$.

Proposition

Let \mathcal{C} be an n -category with finite products, then $Fun^{CM}(N_*(Fin_*), \mathcal{C}) \xrightarrow{\sim} Fun^{CM}(N_*(Fin_*)_{\leq (n+2)}, \mathcal{C})$ is categorical equivalent since in this case any commutative monoid $M : N_*(Fin_*) \rightarrow \mathcal{C}$ is a right Kan extension along $N_*(Fin_*)_{\leq (n+2)} \subset N_*(Fin_*)$.

Higher commutative monoid

Definition (Reformulate commutative monoid)

A commutative monoid in an ordinary category C which admits finite products is a functor $M : (Fin_*)_{\leq 3} \rightarrow C$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the C for $0 \leq n \leq 3$.

Definition

Let C be an ∞ -category with finite products, we define a commutative monoid as a functor $M : N_*(Fin_*) \rightarrow C$ such that the canonical maps $M(\rho_i) : M(\langle n \rangle) \rightarrow M(\langle 1 \rangle)$ exhibit $M(\langle n \rangle) \simeq \prod_{1 \leq i \leq n} M(\langle 1 \rangle)$ in the C for all $n \geq 0$.

Proposition

Let C be an n -category with finite products, then $Fun^{CM}(N_*(Fin_*), C) \xrightarrow{\sim} Fun^{CM}(N_*(Fin_*)_{\leq (n+2)}, C)$ is categorical equivalent since in this case any commutative monoid $M : N_*(Fin_*) \rightarrow C$ is a right Kan extension along $N_*(Fin_*)_{\leq (n+2)} \subset N_*(Fin_*)$.

Definition

A symmetric monoidal ∞ -category is a commutative monoid in \mathcal{Cat}_∞ . Particularly, when a symmetric monoidal ∞ -category \mathcal{C} is $\mathbf{1}$ -category, it is a commutative monoid in the $(\mathcal{Cat}_\infty)_{\leq 1}$, which is a $\mathbf{2}$ -category. So we have

$$CMon(\mathcal{Cat}_{\leq 1}) \xrightarrow{\sim} Fun^{CM}(N_*(Fin_*)_{\leq 4}, (\mathcal{Cat}_\infty)_{\leq 1}).$$

By (un)straightening equivalence $Fun(N_*(Fin_*), \mathcal{Cat}_\infty) \simeq CoCart_{/N_*(Fin_*)}$, we get the following equivalent definition.

Definition

A symmetric monoidal ∞ -category is a coCartesian fibration of simplicial sets

$p : \mathcal{C}^\otimes \rightarrow N_*(Fin_*)$ with the following property:

For each $n \geq 0$, the maps $\{\rho^i : \langle n \rangle \rightarrow \langle 1 \rangle\}_{1 \leq i \leq n}$ induce functors $\rho^i : \mathcal{C}_{\langle n \rangle}^\otimes \rightarrow \mathcal{C}_{\langle 1 \rangle}^\otimes$ which determine an equivalence $\mathcal{C}_{\langle n \rangle}^\otimes \simeq (\mathcal{C}_{\langle 1 \rangle}^\otimes)^n$. And define $\mathcal{C}_{\langle 1 \rangle}^\otimes$ as its underlying ∞ -category.

Definition

A symmetric monoidal ∞ -category is a commutative monoid in Cat_∞ . Particularly, when a symmetric monoidal ∞ -category C is 1 -category, it is a commutative monoid in the $(Cat_\infty)_{\leq 1}$, which is a 2 -category. So we have

$$CMon(Cat_{\leq 1}) \xrightarrow{\sim} Fun^{CM}(N_*(Fin_*), (Cat_\infty)_{\leq 1}).$$

By (un)straightening equivalence $Fun(N_*(Fin_*), Cat_\infty) \simeq CoCart_{/N_*(Fin_*)}$, we get the following equivalent definition.

Definition

A symmetric monoidal ∞ -category is a coCartesian fibration of simplicial sets

$p : \mathcal{C}^\otimes \rightarrow N_*(Fin_*)$ with the following property:

For each $n \geq 0$, the maps $\{\rho^i : \langle n \rangle \rightarrow \langle 1 \rangle\}_{1 \leq i \leq n}$ induce functors $\rho^i : \mathcal{C}_{\langle n \rangle}^\otimes \rightarrow \mathcal{C}_{\langle 1 \rangle}^\otimes$ which determine an equivalence $\mathcal{C}_{\langle n \rangle}^\otimes \simeq (\mathcal{C}_{\langle 1 \rangle}^\otimes)^n$. And define $\mathcal{C}_{\langle 1 \rangle}^\otimes$ as its underlying ∞ -category.

Tensor product of ∞ -categories

Let \mathbb{K} be the collection of all small simplicial sets.

Definition

Given 2 cocomplete ∞ -categories C and D , we define the tensor product as a functor $C \times D \rightarrow C \otimes D$ such that for any cocomplete E , we have $Fun^{\mathbb{K}}(C \otimes D, E) \xrightarrow{\sim} Fun^{\mathbb{K} \boxtimes \mathbb{K}}(C \times D, E)$. Such tensor product always exists because the natural functor $C \times D \rightarrow \mathcal{P}_{\mathbb{K} \boxtimes \mathbb{K}}^{\mathbb{K}}(C \times D)$ satisfies that.

Theorem

The above gives a symmetric monoidal structure $\widehat{Cat}_{\infty}(\mathbb{K})^{\otimes} \rightarrow N_*(Fin_*)$ and makes the cocompletion functor a symmetric monoidal adjunction $\widehat{Cat}_{\infty}^{\otimes} \rightleftarrows \widehat{Cat}_{\infty}(\mathbb{K})^{\otimes}$. So $S = \mathcal{P}(\ast)$ is the unit in $\widehat{Cat}_{\infty}(\mathbb{K})^{\otimes}$.

Tensor product of ∞ -categories

Let \mathbb{K} be the collection of all small simplicial sets.

Definition

Given 2 cocomplete ∞ -categories C and D , we define the tensor product as a functor $C \times D \rightarrow C \otimes D$ such that for any cocomplete E , we have $Fun^{\mathbb{K}}(C \otimes D, E) \xrightarrow{\sim} Fun^{\mathbb{K} \boxtimes \mathbb{K}}(C \times D, E)$. Such tensor product always exists because the natural functor $C \times D \rightarrow \mathcal{P}_{\mathbb{K} \boxtimes \mathbb{K}}^{\mathbb{K}}(C \times D)$ satisfies that.

Theorem

The above gives a symmetric monoidal structure $\widehat{Cat}_{\infty}(\mathbb{K})^{\otimes} \rightarrow N_*(Fin_*)$ and makes the cocompletion functor a symmetric monoidal adjunction $\widehat{Cat}_{\infty}^{\otimes} \rightleftarrows \widehat{Cat}_{\infty}(\mathbb{K})^{\otimes}$. So $\mathcal{S} = \mathcal{P}(*)$ is the unit in $\widehat{Cat}_{\infty}(\mathbb{K})^{\otimes}$.

Cocomplete symmetric monoidal structure

Remark

By (un)straightening equivalence, $\mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K})) \subset \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty)$ is the subcategory whose objects are symmetric monoidal ∞ -categories such that $- \otimes -$ preserves colimits separately in each variable (called **cocomplete symmetric monoidal** categories), and whose morphisms are **colimit-preserving** symmetric monoidal functors.

Corollary

The symmetric monoidal adjunction induces an adjunction between algebras $F : \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty) \rightleftarrows \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K}))$.

Corollary

- (1) The $\mathcal{S} = \mathcal{P}(\ast)$ is the unit in $\widehat{\mathcal{Cat}}_\infty(\mathbb{K})^\otimes$, which means it is initial object in $\mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K}))$ and hence \mathcal{S} admits a cocomplete symmetric monoidal structure \mathcal{S} .
- (2) So for any cocomplete symmetric monoidal ∞ -category, there exists essentially unique colimit-preserving symmetric monoidal functor $\mathcal{S}^\otimes \rightarrow \mathcal{C}^\otimes$.

Cocomplete symmetric monoidal structure

Remark

By (un)straightening equivalence, $\mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K})) \subset \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty)$ is the subcategory whose objects are symmetric monoidal ∞ -categories such that $- \otimes -$ preserves colimits separately in each variable (called **cocomplete symmetric monoidal** categories), and whose morphisms are **colimit-preserving** symmetric monoidal functors.

Corollary

The symmetric monoidal adjunction induces an adjunction between algebras $F : \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty) \rightleftarrows \mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K}))$.

Corollary

- (1) The $\mathcal{S} = \mathcal{P}(\ast)$ is the unit in $\widehat{\mathcal{Cat}}_\infty(\mathbb{K})^\otimes$, which means it is initial object in $\mathcal{CAL}(\widehat{\mathcal{Cat}}_\infty(\mathbb{K}))$ and hence \mathcal{S} admits a cocomplete symmetric monoidal structure \mathcal{S} .
- (2) So for any cocomplete symmetric monoidal ∞ -category, there exists essentially unique colimit-preserving symmetric monoidal functor $\mathcal{S}^\otimes \rightarrow \mathcal{C}^\otimes$.

Proposition (Localization)

Let \mathcal{C} be an ∞ -category and let $L : \mathcal{C} \rightarrow \mathcal{C}$ be a functor with essential image $L\mathcal{C} \subseteq \mathcal{C}$.

The following conditions are equivalent:

- (1) There exists a functor $f : \mathcal{C} \rightarrow \mathcal{D}$ with a fully faithful right adjoint $g : \mathcal{D} \rightarrow \mathcal{C}$ and an equivalence between $g \circ f$ and L .
- (2) When regarded as a functor from \mathcal{C} to $L\mathcal{C}$, L is a left adjoint of the inclusion $L\mathcal{C} \subseteq \mathcal{C}$.
- (3) There exists a natural transformation from $\mathrm{id}_{\mathcal{C}} \rightarrow L$ such that, $L \circ \mathrm{id}_{\mathcal{C}} \rightarrow L \circ L$ and $\mathrm{id}_{\mathcal{C}} \circ L \rightarrow L \circ L$ are equivalences in $\mathrm{Fun}(\mathcal{C}, \mathcal{C})$, i.e. an idempotent object in $\mathrm{Fun}(\mathcal{C}, \mathcal{C})$.

Proposition

The full subcat $Pr^L \subset \widehat{Cat}_{\infty}(\mathbb{K})$ is closed under tensor product and hence inherits a symmetric monoidal structure Pr_L^{\otimes} .

Bousfield localization

Let \mathcal{C}^\otimes be a presentable symmetric monoidal category, i.e. an object in $\mathcal{CAL}(\mathcal{Pr}^L)$.

Theorem (Bousfield localization)

Let $E \in \mathcal{C}$ be an object, then $W_E = \{X \rightarrow Y \mid X \otimes E \xrightarrow{\sim} Y \otimes E\} \subset \text{Fun}(\Delta^1, \mathcal{C})$ is a small-generated strongly saturated collection, which means there exists an accessible localization functor $L_E : \mathcal{C} \rightarrow \mathcal{C}$.

Furthermore, Bousfield localization is compatible with its symmetric monoidal structure, meaning it forms a symmetric monoidal adjunction $\mathcal{C}^\otimes \rightleftarrows \mathcal{C}_E^\otimes$.

Corollary

Symmetric monoidal adjunction gives an adjunction $\mathcal{CAL}(\mathcal{C}) \rightleftarrows \mathcal{CAL}(\mathcal{C}_E)$. And a morphism $A \rightarrow B$ in $\mathcal{CAL}(\mathcal{C})$ is a $\mathcal{CAL}(\mathcal{C}_E)$ -localization iff underlying $p(A) \rightarrow p(B)$ is an E -localization in \mathcal{C} .

Localization and idempotent object

Definition (idempotent object)

Let \mathcal{C} be a monoidal (∞ -)category. A morphism $1_{\mathcal{C}} \rightarrow X$ is idempotent iff $1_{\mathcal{C}} \otimes X \rightarrow X \otimes X$ and $X \otimes 1_{\mathcal{C}} \rightarrow X \otimes X$ are equivalences. (e.g. $\mathbb{Z} \rightarrow \mathbb{Z}[1/p]$)

Theorem

Let \mathcal{C} be a symmetric monoidal ∞ -category and let $e : 1 \rightarrow E$ be a morphism in \mathcal{C} . The following conditions are equivalent:

- (1) The map e exhibits E as an idempotent object of \mathcal{C} .
- (2) Let $l_E : \mathcal{C} \rightarrow \mathcal{C}$ be the functor given by left tensor product with E . Then e induces a functor $\alpha : \mathrm{id}_{\mathcal{C}} \rightarrow l_E$ which exhibits l_E as a localization functor on \mathcal{C} .

Localization and idempotent object

Definition (idempotent object)

Let \mathcal{C} be a monoidal (∞ -)category. A morphism $1_{\mathcal{C}} \rightarrow X$ is idempotent iff $1_{\mathcal{C}} \otimes X \rightarrow X \otimes X$ and $X \otimes 1_{\mathcal{C}} \rightarrow X \otimes X$ are equivalences. (e.g. $\mathbb{Z} \rightarrow \mathbb{Z}[1/p]$)

Theorem

Let \mathcal{C} be a symmetric monoidal ∞ -category and let $e : 1 \rightarrow E$ be a morphism in \mathcal{C} . The following conditions are equivalent:

- (1) The map e exhibits E as an idempotent object of \mathcal{C} .
- (2) Let $l_E : \mathcal{C} \rightarrow \mathcal{C}$ be the functor given by left tensor product with E . Then e induces a functor $\alpha : \text{id}_{\mathcal{C}} \rightarrow l_E$ which exhibits l_E as a localization functor on \mathcal{C} .

Symmetric localization and idempotent algebra

Definition

Let \mathcal{C} be a symmetric monoidal ∞ -category. We will say that a commutative algebra object $A \in \mathbf{CAlg}(\mathcal{C})$ is idempotent if unit map $e : \mathbf{1} \rightarrow A$ is idempotent.

Theorem

Let \mathcal{C} be a symmetric monoidal ∞ -category with unit object $\mathbf{1}$, which we regard as a trivial algebra object of \mathcal{C} . Then the functor

$$\theta : \mathbf{CAlg}^{\text{idem}}(\mathcal{C}) \subseteq \mathbf{CAlg}(\mathcal{C}) \simeq \mathbf{CAlg}(\mathcal{C})_{\mathbf{1}/} \rightarrow \mathcal{C}_{\mathbf{1}/}$$

is fully faithful, and its essential image are idempotent objects in \mathcal{C} , which gives an equivalence $\mathbf{CAlg}^{\text{idem}}(\mathcal{C}) \xrightarrow{\sim} (\mathcal{C}_{\mathbf{1}/})^{\text{idem}}$. Furthermore, any mapping space in $(\mathcal{C}_{\mathbf{1}/})^{\text{idem}}$ is either empty or contractible, i.e. it is a 0-category and equivalent to a partial-order set $N(I)$.

Symmetric localization and idempotent algebra

Definition

Let \mathcal{C} be a symmetric monoidal ∞ -category. We will say that a commutative algebra object $A \in \mathbf{CAlg}(\mathcal{C})$ is idempotent if unit map $e : \mathbf{1} \rightarrow A$ is idempotent.

Theorem

Let \mathcal{C} be a symmetric monoidal ∞ -category with unit object $\mathbf{1}$, which we regard as a trivial algebra object of \mathcal{C} . Then the functor

$$\theta : \mathbf{CAlg}^{\text{idem}}(\mathcal{C}) \subseteq \mathbf{CAlg}(\mathcal{C}) \simeq \mathbf{CAlg}(\mathcal{C})_{1/} \rightarrow \mathcal{C}_{1/}$$

is fully faithful, and its essential image are idempotent objects in \mathcal{C} , which gives an equivalence $\mathbf{CAlg}^{\text{idem}}(\mathcal{C}) \xrightarrow{\sim} (\mathcal{C}_{1/})^{\text{idem}}$. Furthermore, any mapping space in $(\mathcal{C}_{1/})^{\text{idem}}$ is either empty or contractible, i.e. it is a $\mathbf{0}$ -category and equivalent to a partial-order set $N(I)$.

Proposition

The full subcat $Pr^L \subset \widehat{Cat}_\infty(\mathbb{K})$ is closed under tensor product (so \mathcal{S} is also the unit in Pr^L) and hence inherits a symmetric monoidal structure. In this case, for any $C, D \in Pr^L$, we have natural equivalence $C \otimes D \simeq RFun(C^{op}, D)$.

Theorem

The following 3 colimit-preserving functors $\mathcal{S} \xrightarrow{\tau_{\leq n}} \tau_{\leq n}\mathcal{S}$, $\mathcal{S} \xrightarrow{(-)_+} \mathcal{S}_*$ and $\mathcal{S} \xrightarrow{\Sigma_+^\infty} Sp$ are idempotent objects in Pr^L . Let \mathcal{C} be a presentable ∞ -category, then

- (1) The functor $\tau_{\leq n}$ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes \tau_{\leq n}\mathcal{S} \simeq \tau_{\leq n}\mathcal{C}$ which exhibits θ as an n -truncation functor.
- (2) The functor $(-)_+$ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes \mathcal{S}_* \simeq \mathcal{C}_*$ which exhibits θ as a copointedlization functor.
- (3) The functor Σ_+^∞ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes Sp \simeq Sp(\mathcal{C})$ which exhibits θ as a cospectralization functor.

Proposition

The full subcat $Pr^L \subset \widehat{Cat}_\infty(\mathbb{K})$ is closed under tensor product (so \mathcal{S} is also the unit in Pr^L) and hence inherits a symmetric monoidal structure. In this case, for any $C, D \in Pr^L$, we have natural equivalence $C \otimes D \simeq RFun(C^{op}, D)$.

Theorem

The following 3 colimit-preserving functors $\mathcal{S} \xrightarrow{\tau_{\leq n}} \tau_{\leq n}\mathcal{S}$, $\mathcal{S} \xrightarrow{(-)_+} \mathcal{S}_*$ and $\mathcal{S} \xrightarrow{\Sigma_+^\infty} Sp$ are idempotent objects in Pr^L . Let \mathcal{C} be a presentable ∞ -category, then

- (1) The functor $\tau_{\leq n}$ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes \tau_{\leq n}\mathcal{S} \simeq \tau_{\leq n}\mathcal{C}$ which exhibits θ as an n -truncation functor.
- (2) The functor $(-)_+$ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes \mathcal{S}_* \simeq \mathcal{C}_*$ which exhibits θ as a copointedlization functor.
- (3) The functor Σ_+^∞ induces a map $\theta : \mathcal{C} \simeq \mathcal{C} \otimes \mathcal{S} \rightarrow \mathcal{C} \otimes Sp \simeq Sp(\mathcal{C})$ which exhibits θ as a cospectralization functor.

Corollary

By $\mathbf{CAlg}(Pr^L)^{\text{idem}} \xrightarrow{\sim} (Pr_{\mathcal{S}'}^L)^{\text{idem}}$ and the fact that $\mathcal{S} \xrightarrow{\tau_{\leq n}} \tau_{\leq n}\mathcal{S}$, $\mathcal{S} \xrightarrow{(-)_+} \mathcal{S}_*$,
 $\mathcal{S} \xrightarrow{\Sigma_+^\infty} Sp \in (Pr_{\mathcal{S}'}^L)^{\text{idem}}$,

- (1) There is a unique cocomplete symmetric monoidal structure on \mathcal{S} such that $*$ is the unit, which coincides its **Cartesian monoidal** structure.
- (2) There is a unique cocomplete symmetric monoidal structure on $\tau_{\leq n}\mathcal{S}$ such that $*$ is the unit, which coincides its **Cartesian monoidal** structure.
- (3) There is a unique cocomplete symmetric monoidal structure on \mathcal{S}_* such that \mathcal{S}^0 is the unit.
- (4) There is a unique cocomplete symmetric monoidal structure on Sp such that $\Sigma^\infty \mathcal{S}^0$ is the unit.

Bousfield localization with respect to an idempotent object

Theorem

Let \mathcal{C}^\otimes be a symmetric monoidal ∞ -category and $1_{\mathcal{C}} \rightarrow E$ be an idempotent object in \mathcal{C} , then there exists a symmetric monoidal localization $L_E^\otimes : \mathcal{C}^\otimes \rightleftarrows \mathcal{C}_E^\otimes$. Furthermore, The inclusion $\mathcal{C}_E^\otimes \rightarrow \mathcal{C}^\otimes$ is closed under tensor product and hence (strong) symmetric monoidal.

Corollary

The following 3 collections of presentable ∞ -categories are closed under tensor product:

- (1) Pointed presentable ∞ -categories;
- (2) Stable presentable ∞ -categories;
- (3) Presentable $(n+1)$ -categories.
